

Brainstorming & Idea Prioritization Template

Date	27-08-2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

1. Problem Background

Network service requests such as VPN access, firewall access, IP allocation, port opening, connectivity issues and network configuration changes are often handled through emails, calls or manually created tickets. This can cause incomplete information, delayed approvals, repeated follow-ups and poor visibility into request progress.

For this individual project, I identified an opportunity to use ServiceNow to centralize and automate the complete network request lifecycle. The proposed solution uses the Service Catalog for request submission and Flow Designer for routing, approvals, task creation, notifications and tracking.

Step 1 – Problem Identification & Problem Selection

1. Network requests may arrive through multiple communication channels.
2. Important technical details may be missing from submitted requests.
3. Manual approval routing can delay request processing.
4. Network administrators may spend time manually assigning tasks.
5. Requesters may not know the current status of their request.
6. Urgent requests may not be clearly prioritized.
7. Completed network changes may be difficult to track consistently.

Selected Problem Statement

“How can network service requests be automated in ServiceNow so that submission, validation, approval, assignment, tracking and closure become faster, consistent and transparent?”

Identified User Needs

• Simple network request submission	• Collection of mandatory technical information
• Automatic request categorization	• Correct approval routing
• Automatic assignment to the network team	• Clear request status
• Automatic notifications	• Complete request history

Step-2: Brainstorm, Idea Listing and Grouping

I independently generated possible features and improvements for the proposed ServiceNow solution. The ideas were then grouped according to their purpose in the request lifecycle.

Brainstorming Ideas

Idea Area	Proposed Idea
Request Submission	Create a dedicated Network Request catalog item
Request Types	Provide VPN, Firewall, IP, Port and Connectivity request options
Smart Form	Show relevant fields based on the selected request type
Validation	Make essential technical information mandatory
Classification	Set priority using request information
Approval	Automatically route the request to the appropriate approver
Assignment	Create and assign fulfillment tasks to the Network team
Workflow	Use Flow Designer to automate the request lifecycle

Communication	Send notifications when request status changes
Tracking	Allow requesters to monitor progress
Escalation	Notify teams when requests approach target completion time
Audit	Maintain approval and fulfillment history
Dashboard	Display open, pending and completed requests
Reporting	Measure request volume and processing time
Urgent Requests	Create a special path for high-priority network requests

Step 3 – Idea Prioritization

The ideas were prioritized individually using two criteria: **Importance** (business/user impact) and **Feasibility** (ease of implementation in ServiceNow).

Idea	Importance	Feasibility	Priority
Network Service Catalog	High	High	1-Critical
Automated approval routing	High	High	2-Critical
Automatic task assignment	High	High	3-critical
Dynamic request form	High	Medium	4-High
Automatic notifications	Medium	High	5-High
Request status tracking	High	High	6-High
SLA escalation	High		7-High
Network dashboard	Medium	Medium	8-Medium
Advanced analytics	Medium	Medium	9-Medium
Urgent request pathway	Medium	Medium	10-Medium

Step-4: Selected Idea

An **Automated Network Request Management in ServiceNow** was selected as the final idea because it combines self-service request submission, automated approvals, record creation, notifications, and workflow automation into a single solution. This directly addresses the delays and manual effort associated with traditional network request management. The project document identifies these same capabilities as core features of the proposed solution.
