

Define the Problem Statements

Date	27-08-2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Problem Statement

service requests such as new network connections, device-related requests, connectivity requirements, VPN access, firewall changes, IP allocation, and port-opening requests through manual or disconnected processes. Explain that this can cause **delays, incorrect routing, approval bottlenecks, repetitive work, incomplete information, and limited visibility into request status.**

Explain that the proposed **Automated Network Request Management in ServiceNow** provides a centralized self-service mechanism for submitting network requests and automates their subsequent processing. Mention Service Catalog, automated request routing, approvals, task creation, status tracking, and notifications.

Key Problems Identified 1. Manual Request Processing

Network requests require multiple manual activities, increasing processing time and effort.

2. Approval Delays

Requests requiring authorization may be delayed when approval processes are handled manually.

3. Incorrect or Delayed Routing

Without automated workflow, requests may not reach the appropriate network team or responsible person efficiently.

4. Lack of Transparency

Requesters and IT teams may have limited visibility into the current status and progress of a request.

5. Incomplete Request Information

Missing technical details can result in repeated communication and delays in fulfillment.

Problem Statement Summary

Automated Network Request Management in ServiceNow aims to replace manual network request handling with a centralized and automated workflow. The solution will streamline **request submission, validation, approval, routing, tracking, and notifications, reducing delays and manual effort while improving transparency and processing efficiency.**
