

# Customer Journey Map

The **Customer Journey Map** illustrates the end-to-end journey of an employee submitting and tracking a network service request through the Automated Network Request Management system.

You can use the generated map above in your documentation.

## Journey Stages

- 1. Need Identification** – The user identifies a requirement such as a new connection, relocation, or device-related network service.
- 2. Request Submission** – The user accesses the ServiceNow portal, selects the Network Request catalog item, provides the required information, and submits the request.
- 3. Validation & Approval** – The submitted request is processed through the configured workflow and routed for approval.
- 4. Request Fulfillment** – Once approved, the request is assigned for fulfillment and the required network record/task is created.

5. **Notification & Updates** – Users receive updates regarding approval, processing, and completion through notifications.
6. **Request Closure** – After fulfillment, the request is completed and closed.

This journey reflects the project's intended flow of **self-service submission → automated processing → approval → fulfillment → notifications → closure**.
