

Planning Logic

Date	27-8-2026
Project Name	Automated-Network-Request Management
Maximum Marks	2 Marks

The planning logic defines the step-by-step approach used to design and implement the **Automated Network Request Management System in ServiceNow**. It ensures that the project moves systematically from identifying the problem to building, testing, and validating the automated workflow.

Planning Steps

Step	Planning Logic
1. Identify Need	Identify problems in the existing network request process.
2. Define Requirements	Determine required information, approvals, records, and notifications.
3. Design Request Form	Create the Network Request catalog item and configure variables.
4. Create Data Structure	Create the Network Database table and required fields.
5. Automate Workflow	Build the Flow Designer workflow for request processing.
6. Apply Approval Logic	Route requests for approval and handle approval/rejection.
7. Fulfill Request	Create the required record/task for the IT/Network team.
8. Notify Users	Send notifications about approval, processing, and status.
9. Update & Close	Update the record and close the request after fulfillment.
10. Test & Validate	Test the complete workflow using sample requests.

Planning Logic Flow

Identify Problem → Define Requirements → Design → Build Data → Automate → Approve → Fulfill → Notify → Close → Test & Validate

The generated infographic above can be used directly in the **Planning Logic** section of your project documentation. The workflow stages are consistent with the project's documented implementation of catalog variables, table creation, approvals, Flow Designer actions, notifications, and record updates.

Planning Logic

The planning logic defines the step-by-step approach to design and implement the Automated Network Request Management System in ServiceNow. Each step ensures smooth flow from request submission to fulfillment and closure.

Step		Planning Logic Description
1. Identify Need		Identify the problems in the existing network request process.
2. Define Requirements		Determine the information, approvals, records, and notifications required.
3. Design Request Form		Create the Network Request catalog item and configure the required variables.
4. Create Data Structure		Create the Network Database table and required fields to store request information.
5. Automate Workflow		Build the Flow Designer workflow to process submitted requests automatically.
6. Apply Approval Logic		Route requests for approval and handle approved or rejected outcomes.
7. Fulfill Request		Create the required record/task and allow the IT/Network team to process it.
8. Notify Users		Send notifications regarding approval, processing, and request status.
9. Update & Close		Update the request record and close it after successful fulfillment.
10. Test & Validate		Test the complete workflow using sample requests and verify each stage.
